

Duo-cut

One of the challenges with cutting is to avoid burr on the exit side. A Core Link core cutter normally cuts from outside towards the inside of the core. This procedure causes some burr on the inside unless the edge of the blade is very sharp. The solution of avoiding burr entirely is Core Links patented 'Duo-cut'.

Operation mode:

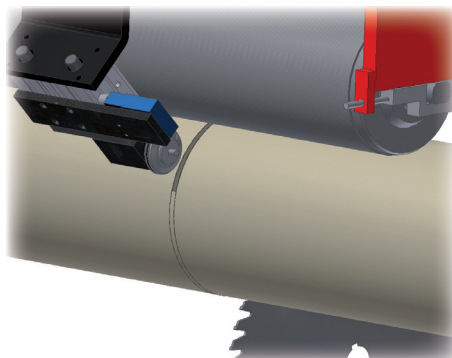

Two shallow slits will be cut into outer paper layer before the saw blade cuts the core between the slits.

The saw blade is cutting the core from the inside and out, i.e. the core (A) is rotated to meet the teeth of the saw blade (B).

This minimizes the appearance of burr on the outside of the core.

Why Duo-cut?

- No burr on the inside or the outside of the core
- Minimized amount of dust inside the core
- Deburring and cutting cores in the same process

Most of Core Link core cutters can be retrofitted with Duo-cut
